

Quantified Modal Logic Wffs

For practice, you might do the following. Assuming the constant domains definition of a model, for each formula, give a validity proof if the wff is valid, and a countermodel if it is invalid. Indicate whether and how the status of the wff would change given the varying domains definition of a model.

1. $\forall x \forall y (x \neq y \rightarrow \square x \neq y)$
2. $\forall x \square \exists y x = y$
3. $\exists x \square x = a$
4. $\forall x \square \forall y x = y$
5. $\square \exists x Fx \rightarrow \diamond \forall x Fx$
6. $\diamond \forall x Fx \rightarrow \exists x \diamond Fx$
7. $\diamond \forall x Fx \rightarrow \sim \exists x \square \sim Fx$
8. $(\diamond Fa \wedge \diamond Ga) \rightarrow \diamond(Fa \wedge Ga)$
9. $\exists x \diamond Rax \rightarrow \diamond \square \exists x \exists y Rx y$
10. $\square \forall x (Fx \rightarrow Gx) \rightarrow (\forall x \square Fx \rightarrow \square \forall x Gx)$
11. $\square \forall x (Fx \vee Gx) \rightarrow \forall x (\square Fx \vee \square Gx)$
12. $\exists x \square (Fx \vee Gx) \rightarrow \square (\forall x Fx \vee \exists x Gx)$
13. $\forall x (Fx \rightarrow \diamond Gx) \rightarrow \diamond \forall x (Fx \rightarrow Gx)$
14. $\forall x (\square Fx \vee \square Gx) \rightarrow \square \forall x (Fx \vee Gx)$
15. $\square \forall x (Fx \rightarrow Gx) \rightarrow \forall x (Fx \rightarrow \square Gx)$
16. $(\square \forall x (Fx \rightarrow \square Fx) \wedge \diamond \exists x Fx) \rightarrow \square \exists x Fx$
17. $\exists x (Nx \wedge \forall y (Ny \rightarrow y = x) \wedge \square Ox) \rightarrow \square \exists x (Nx \wedge \forall y (Ny \rightarrow y = x) \wedge Ox)$
